CA: 47-00

903 PAD CHARACTERIZATION REPORT AVAILABLE

The 903 Pad Characterization Report summarizing the data showing the location, area, and volume of soil potentially requiring evaluation, management, or remedial action at Individual Hazardous Substance Site (IHSS) for the 903 Drum storage Area, 903 Lip Area, and Americium Zone is now available for review.

The primary purpose of the investigation leading up to the Characterization Report was to estimate the volume of contaminated soil above the Rocky Flats Cleanup Agreement (RFCA) Tier I Radionuclide Soil Action Levels (RSALS). The secondary purpose of the investigation was to characterize surface soil to 10pCi/g americium-241 (241 Am) using gamma spectroscopy field instrumentation. The characterization also identifies surface soils exceeding Tier II RSALS. The remedial alternatives will be evaluated in the Interim Measure/Interim Remedial Action (IM/IRA) Decision Document based on these volume estimates.

Please visit our web site at www.rfets.gov for an electronic copy of the Executive Summary and the Acronym listing.

If you have any questions regarding this report, please call Norma Castaneda at 303-966-4226.

A complete copy of the 903 Characterization Report and related maps is available for review at the following public reading rooms:
